*Fisher Space Pen
Writes Upside Down*

Thanks to its sealed, pressurized cartridge and specially formulated ink, Fisher Space Pen writes upside down, right-side up, and any way in between. Designed for outer space and selected by NASA for all Apollo flights, it also writes in gravity-free void and in temperatures from 400° above to 50° below. Home on earth, under less demanding conditions, countless delighted users have come to rely on Space Pen because it never skips or blots, writes over grease, fingerprints, on glossy photos, acetate, even under water and of course in any position (on vertical clipboard or leaning against a wall!) Superbly styled, with Apollo crest, gift boxed and at a down-to-earth price!

Please send me ___ Fisher Space Pens in Chrome Finish at \$5.00.
___ Extra cartridges at \$1.00.
I enclose the total, plus \$1 post. & insurance. (California add tax)
Return in 2 wks. if not delighted.

A lot of developing countries aren't sure they want the most advanced medical technology... A computer could legally take out a patent on something it invented... An Assistant Secretary of the Navy thinks that modern management procedures make things worse by distracting us from real events... Basic thermodynamics and simple inorganic chemistry have yielded a many-layered structure for the atmosphere of Jupiter which fits every observation... Controlling sulfur emissions from power plants is likely to take until the end of the century and cost between \$500 million and \$2 billion... A microbalance has been made in which the restoring force is the radiation pressure of a light beam... the New York City Fire Department could save \$20 million a year by adding a friction-reducing agent to the water it pumps... Pollution is anything tending to make an ecosystem unstable... There are ten fundamentally separate ways of preventing accidents... Organized crime makes better use of science and technology than many city governments...

All these were in the last nine issues of Technology Review, the new national magazine edited at the Massachusetts Institute of Technology. So were a major report on nuclear-powered aircraft design, an in-depth study of the world protein problem, the case against the growth economy, an analysis of why industrial building never gets started, an explanation of how the new urban transit systems are worse than the old ones. Also nine columns by Robert C. Cowen of the Christian Science Monitor and Victor Cohn of the Washington Post... book reviews... puzzles and games. You could have had all this — and more — for \$9 starting last fall. If you want it this fall, use the coupon.

Send to: Technology Review, Room E19-430, M.I.T., Cambridge, Massachusetts, 02139.

Enter my subscription for one year of Technology Review at \$9 (\$10 in Canada and other foreign countries).
